

ENHANCE THE EXPERIENCE OF YOUR DATACENTER AND CLOUD DEPLOYMENTS

why

- ✓ cloud strategy - out of the box
- ✓ smart and slim digital transformation
- ✓ eliminate IT sunk costs and make cloud technology commodity
- ✓ multi-hybrid cloud management
- ✓ fast enablement of IT teams in cloud technologies

XOSS is an abstraction layer for code-based implementations of IT infrastructures, services and solutions on-premises and in the cloud.

The open architecture enables dynamic adaptation of the most diverse requirements. This solution is based on different products, which all can be separately implemented as single units.

*If nothing ever changed
here'd be no butterfly.*

*Experience what XOSS will
do for your cloud strategy.*

added values

- install your complete IT infrastructure into the cloud or on premises fully automated
- Migrate your services and applications fully automated in the most cost-effective cloud
- create redistributable infrastructures for different platforms
- zero-touch deployment of workspaces including applications and configurations
- standardized Windows/Linux images for on-premises or cloud platforms
- ensure that all systems are matching their intended configuration and remain in the correct state - worldwide and anytime
- deploy applications and packages to servers, VDIs or notebooks everywhere
- continuous server/client configuration, monitoring and reporting
- re-deployment of the entire infrastructure to another location or to another cloud
- scalable infrastructure through your own hybrid multi-cloud strategy

Achieve all of the above - across on-premises and cloud technologies from one single console.

Spread your wings and fly.

XOSS enables end-users and IT organizations to access services, tools, applications and desktops from any connected device regardless of their location.

With our extensive experience in delivering datacenters, end-user computing (EUC) and virtual desktop infrastructures (VDI) with customers worldwide, we use our know-how to deliver a simple yet powerful platform that can adapt to your service and workspace needs now and in the future.

IMAGE.XO

Fully automated provisioning of Windows and Linux operating-systems on-premises and in the cloud.

PLATFORM.XO

Platform independent creation of completely unattended IT infrastructures on-premises and in the cloud.

APPLICATION.XO

Creation and installation of application groups and roles by adding individual or provided packages.

CONFIG.XO

Configuration, installation and management of applications and system components.

PROFILE.XO

Customization and management of the user environment during logon and logoff.

INSIGHTS.XO

Monitoring and analyzing the infrastructure, desktops and user environments.

EXTENSIONS.XO

Modular system, integrate further solutions, such as uberAgent, deviceTRUST or other products.

AGENT.XO

Endpoint troubleshooting and analytics for all connected nodes and modules.

XOSS is a cloud-hosted application, that empowers any organization to deliver and manage their infrastructures and virtual desktops via a single console for seamless control and administration.

By implementing code-based solutions in hybrid and multi-cloud environments we learned that the enormous complexity of the various tools and their handling is a huge challenge.

Therefore, our application offers easy management of all tools in hybrid environments including all necessary components to increase the transformational speed of the responsible teams when dealing with Infrastructure as Code technologies.

Special attention was paid to the dashboard, orchestration, monitoring and security components. Due to the modular design, all components can also be used or licensed individually.
